

Behavioral Research System (BRS)

Version 1.0 MVP Specification

Project Status

Week 1: Complete 

1. Vision

Build a personal behavioral research system that helps discover what interventions genuinely improve behavior through evidence, not motivation.

This is a personal project first.

The objective is not to build a startup.

The objective is to build a system that I will personally use every day.

2. Core Philosophy

The problem is not lack of knowledge.

The problem is the gap between intention and behavior.

The application exists to understand that gap.

It should answer behavioral questions using evidence collected over time rather than assumptions or generic advice.

3. Product Principles

- Daily logging must take less than two minutes.
- Daily logging collects observations only.
- No daily analysis.
- No daily advice.
- AI never interrupts an experiment.
- AI analyzes only after a completed cycle.

- Every field exists because it helps answer a behavioral question.
 - Understanding behavior is more important than tracking streaks.
-

4. MVP Goal

Collect high-quality behavioral data with minimal friction.

Produce meaningful insights only after enough evidence has been collected.

5. User Journey

Planning

Choose:

- Goal
- Hypothesis
- Intervention

Start experiment.

Daily

Open app.

Log today's information.

Save.

Close app.

No analysis.

After Validation

AI analyzes the collected evidence.

User reflects.

Next intervention is designed.

Repeat.

6. Daily Log Schema

State

- Sleep Start
- Sleep End
- Mood
- Energy

Goal Activities

- Gym (Duration)
- DSA (Duration)
- Project (Duration)
- Reading (Duration)
- College Study (Duration)

Negative Behaviors

- Doomscrolling (Duration)
- Porn (Yes/No)
- Masturbation (Yes/No)

Current Intervention

- Followed today's intervention?
- Yes
- No
- Not Applicable

Reflection

One question:

"What had the biggest impact on today?"

Maximum 2-3 sentences.

7. Experiment Model

Every experiment contains:

Goal

Hypothesis

Intervention

Success Metric

Start Date

End Date

Adherence

Result

Reflection

Conclusion

8. Experiment Cycle

Validation Phase

21 days

Purpose:

Determine whether the intervention is effective under normal daily life.

Daily activity:

Only log observations.

No AI.

No changes.

Analysis Day

Purpose:

Analyze the completed validation phase.

AI responsibilities:

- Identify patterns.
- Compare with previous cycles.
- Evaluate adherence.
- Evaluate effectiveness.
- Generate improved hypotheses.
- Recommend the next intervention.

User responsibilities:

Reflect on the completed cycle.

Choose the next intervention.

Exploration Phase

9 days

Purpose:

Test whether the proposed intervention is practical and easy to follow.

Question:

Can this intervention realistically become part of everyday life?

If feasible:

Promote it to the next 21-day Validation Phase.

If not:

Discard or modify it.

9. AI's Role

AI is not a coach.

AI is not a therapist.

AI is not a motivational speaker.

AI is a behavioral analyst.

It observes.

Finds evidence.

Generates hypotheses.

Evaluates interventions.

Improves future experiments.

10. Success Metric

The application's success is not measured by streaks or habits completed.

Success is measured by how accurately it understands behavior and how effectively it identifies interventions that are both effective and sustainable.

11. Out of Scope (Version 1)

- Notifications
 - Gamification
 - Social features
 - Achievements
 - Wearables
 - Browser extensions
 - Automatic intervention generation during experiments
-

12. Version 1 Completion Criteria

Version 1 is complete when a user can:

1. Create an intervention.
 2. Log daily data in under two minutes.
 3. View previous entries.
 4. Complete a full 21-day Validation Phase.
 5. Complete a 9-day Exploration Phase.
 6. Receive an AI-generated analysis after the completed cycle.
 7. Start the next intervention using the previous cycle's evidence.
 8. AI model like ChatGpt/Gemini Integration
-

Week 1 Outcome

The MVP is fully defined.

From this point onward, product design is frozen.

Future improvements should come from using the system rather than brainstorming additional features.
